SMALL AND COMPACT – TWO KEY BENEFITS OF E-SHUTTLE 200.

**Powerful combination of technologies**

E-Shuttle 200 is a compact, space-saving conveyor for pretreatment and dip-coating in the automotive industry. Its unique combination of a shuttle system and pendulum technology ensures quick and efficient coating – making it ideal for high throughputs. At the same time, it delivers a consistently high-quality surface finish.

**The shuttle method**

E-Shuttle 200 transports vehicle bodies through the process baths for pretreatment and electro-dip coating on individual trolleys. The bodies turn through 360° in the baths. The shuttles have on-board controllers that allow specific process times to be programmed for each bath and body type. In addition, certain baths can be omitted. And with continuous position sensing, E-Shuttle coordinates all movements system-wide.

**One of the world’s lowest system heights**

The E-Shuttle 200 comprises two freely programmable axes – one horizontal and one rotation axis. A pendulum frame is attached to the rotation axis. It is connected to the skid holding the vehicle body at both ends via a driveless pendulum. The pendulum frame enables a slim-line, compact design by eliminating the need for a lifting axis. Depending on the configuration, the system can be as little as six meters high. Moreover, the pendulum frame can be folded away on the return path to save even more space. And the combination of a shuttle system and pendulum technology means shorter baths can be installed. With its compact design, E-Shuttle 200 is highly suited to brownfield plants.

Advantages at a glance
- One of the world’s lowest system heights, thanks to compact, space-saving design
- Ingenious pendulum technology for simple rotation
- Ideal system for brownfield plants
